AI CUES What is the overall purpose of cellular respiration? What are the three main stages? ATPglucose breakdownexergonic	Cellular respiration is the process of breaking down glucose to release energy stored as ATP. Overall equation: $C_6H_{12}O_6 + 6 O_2 \rightarrow 6 CO_2 + 6 H_2O + ATP$. Occurs in three main stages: glycolysis, the Krebs cycle, and the electron transport chain.
AI CUES Where does glycolysis occur and does it need oxygen? What is the net ATP yield of glycolysis? cytoplasmpyruvate2 ATP netanaerobic	Glycolysis happens in the cytoplasm and does not require oxygen (anaerobic). One glucose (6C) is split into two pyruvate (3C) molecules. Net yield: 2 ATP and 2 NADH per glucose.
AI CUES In which organelle compartment does the Krebs cycle run? What electron carriers are produced per glucose? mitochondrial matrixacetyl-CoANADHFADH₂	The Krebs cycle takes place in the mitochondrial matrix. Each acetyl-CoA entering the cycle releases CO_2 and transfers electrons to NAD^+ and FAD. Per glucose (two turns): 2 ATP, 6 NADH, and 2 $FADH_2$ are produced.
AI CUES	The electron transport chain is embedded in the inner
